# How can we solve and apply linear constant coefficient ODEs?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへで

### Math 238

### Module C

- Section C Section C Section C Section C
- Section C.4 Section C.5

At the end of this module, students will be able to...

- **C1. Constant coefficient first order.** ...find the general solution to a first order constant coefficient ODE.
- **C2. Modeling motion in viscous fluids.** ...model the motion of a falling object with linear drag
- **C3.** Homogeneous constant coefficient second order. ...find the general solution to a homogeneous second order constant coefficient ODE.
- C4. IVPs. ...solve initial value problems for constant coefficient ODEs
- **C5.** Non-homogenous constant coefficient second order. ...find the general solution to a non-homogeneous second order constant coefficient ODE
- **C6. Modeling oscillators.** ...model (free or forced, damped or undamped) mechanical oscillators with a second order ODE

### **Readiness Assurance Outcomes**

Before beginning this module, each student should be able to...

- Describe Newton's laws in terms of differential equations.
- Find all roots of a quadratic polynomial.
- Use Euler's theorem to relate sin(t), cos(t), and  $e^t$ .
- Use Euler's theorem to simplify complex exponentials.
- Use substitution to compute indefinite integrals.
- Use integration by parts to compute indefinite integrals.
- Solve systems of two linear equations in two variables.

### Activity C.1.2 ( $\sim$ 5 min)

List all of the forces acting on a tiny droplet of water falling from the sky.

### Math 238

### Module C

Section C.1 Section C.2 Section C.3 Section C.4 Section C.5

### Activity C.1.3 (~5 min)

Tiny droplets of water obey **Stoke's law**, which says that air resistance is proportional to (the magnitude of) velocity.

- Let v be the velocity of a droplet of water (positive for upward, negative for downward).
- Let g > 0 be the magnitude of acceleration due to gravity and b > 0 be another positive constant.

Apply Newton's second law (force = mass  $\times$  acceleration) to determine which of the following ordinary differential equations (ODEs) models the velocity of a falling droplet of water.

(a) 
$$v' = g - v$$
  
(b)  $v' = g + v$   
(c)  $mv' = -mg - bv$   
(d)  $mv' = -mg + bv$ 

Math 238

### Module C

Section C.1 Section C.2 Section C.3 Section C.4 Section C.5

### **Observation C.1.4** The modeling equation

$$mv' = -mg - bv$$

may be obtained by splitting the total force into gravity and air resistance:

$$F = F_g + F_r$$

Then F = ma = mv' and  $F_g = m(-g) = -mg$  are the result of Newton's second law, and  $F_r = -bv$  holds because it should be (a) in the opposite direction of velocity and (b) a constant multiple of velocity.

Note that this equation may be rearranged as follows to group v and its derivative v' together on the left-hand side:

$$v' + \left(\frac{b}{m}\right)v = -g$$

Math 238

Section C.3

### Definition C.1.5

A first order constant coefficient differential equation can be written in the form

$$y' + by = f(x),$$

or equivalently,

$$\frac{dy}{dx} + by = f(x).$$

We will use both notations interchangeably.

Here, **first order** refers to the fact that the highest derivative we see is the first derivative of y.

### Definition C.1.9

A differential equation will have many solutions. Each individual solution is said to be a **particular solution**, while the **general solution** encompasses **all** of these by using parameters such as  $C, k, c_0, c_1$  and so on. For example:

- The general solution to the differential equation y' = 2x 3 is  $y = x^2 3x + C$  (as done in Calculus courses).
- The general solution for y' = y is  $y = ke^{x}$  (as done in the previous activity).

Activity C.3.5 (~5 min)

The general solution  $y = c_1 \cos(t) + c_2 \sin(t)$  models infinitely oscillating behavior, but in applications this does not occur.

Thus, a damper (a.k.a. dashpot) is often considered, which provides a force proportional to velocity, given by the coefficient b > 0. For example, friction may act as a damper to a mass-spring system.

Write a differential equation modeling the displacement of a mass in a **damped** mass-spring system.

Math 238

#### Module C Section C.1 Section C.2

Section C.3 Section C.4

# Observation C.3.6

The damped mass-spring system can be modelled by

$$my'' = -by' - ky.$$

Here m is the mass, k is the spring constant, and b is the damping constant. We can rearrange this as

$$y'' + By' + Ky = 0$$

where  $B = \frac{b}{m}$  and  $K = \frac{k}{m}$ .

This is a **homogeneous second order constant coefficient** differential equation. Here, **homogeneous** refers to the 0 on the right hand side of the equation.

- **Observation C.3.8**
- It is sometimes useful to think in terms of differential operators.
  - We will use D to represent a derivative. So for any function y,

$$D(y) = \frac{\partial y}{\partial x} = y'.$$

- D<sup>2</sup> will denote the second derivative operator (i.e. differentiate twice, or apply D twice).
- We will use *I* for the identity operator, so I(y) = y. (It can be thought of as  $I = D^0$ , take the derivative zero times.)

In this language, the differential equation y' + 3y = 0 can be rewritten as D(y) + 3I(y) = 0, or more simply (D + 3I)(y) = 0.

Thus, the question of solving the homogeneous differential equation is the question of finding the **kernel** of the differential operator D + 3I: all the functions y that the transformation D + 3I turns into the zero function.

Consider the following scenario: a mass of 4 kg suspended from a damped spring with spring constant  $k = 2 \text{ kg/s}^2$  and damping constant b = 6 kg/s. As previously discussed, this is modeled by the ODE

$$my'' = -by' - ky$$

*Part 1:* Find the general solution for the ODE in terms of m, b, k. *Part 2:* The mass is pulled down 0.3 m from its natural length and released from rest. Use the initial conditions y(0) = ? and y'(0) = ? to find the particular solution modeling this scenario.

#### Math 238

#### Module C

#### Section C.1 Section C.2 Section C.3 Section C.4 Section C.5

# **Activity C.5.3** (~5 min)

A 1 kg mass is suspended from a spring with spring constant  $k = 9 \text{ kg/s}^2$ . No damping is applied, but an external electromagnetic force of  $F(t) = \sin(t)$  is applied. Which of these ODEs models this scenario?

a) 
$$my'' + ky + \sin(t) = 0$$

b) 
$$my'' + ky = \sin(t)$$

c) 
$$my'' + by' = \sin(t)$$

d) 
$$my'' + by' + \sin(t) = 0$$

Math 238

#### Module C

#### Section C.1 Section C.2 Section C.3 Section C.4 Section C.5

# **Observation C.5.4**

Because my'' is the total force acting on the object, -by' - ky is the force acting on the object by the spring, and an additional external force of F(t) is applied, we get my'' = -by' - ky + F(t) which rearranges to

$$my'' + ky = \sin(t)$$

when b = 0 (no damping) and F(t) = sin(t).

This is an example of a **nonhomogeneous** second-order constant coefficient equation of the form

$$ay'' + by' + cy = F(t)$$

since the F(t) = sin(t) term is not a multiple of y or its derivatives. As with first-order examples, these may be solved with variation of parameters.

Part 1: Find  $v_1$  and  $v_2$  by solving

$$y_1 v_1' + y_2 v_2' = 0$$
  
$$y_1' v_1' + y_2' v_2' = \frac{1}{a} f(t)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

for particular solutions  $y_1, y_2$  of  $y''_h + 9y_h = 0$ . Use  $\int \sin(3t)\cos(3t)dt = \frac{1}{6}\sin^2(3t) + C$  and  $\int \sin^2(3t)dt = \frac{1}{6}(3t - \sin(3t)\cos(3t)) + C$ . Part 2: Write the general solution of the original name

Part 2: Write the general solution of the original nonhomogeneous ODE.

# **Activity C.6.1** (~20 min)

A  $3\rm kg$  mass is attached to a spring requires 4 Newtons  $\rm (kg\cdot m/s^2)$  to pull the mass 2 meters from its natural length. No damper is applied. The mass is then released from rest.

### **Activity C.6.1** (~20 min)

A 3kg mass is attached to a spring requires 4 Newtons  $(kg \cdot m/s^2)$  to pull the mass 2 meters from its natural length. No damper is applied. The mass is then released from rest.

Part 1: Adapt the ODE

$$my'' + by' + ky = 0$$

to give an initial value problem modeling this scenario.
